

# DBMS - Notes

Database is collection of related data

DBMS is collection of operations which user can use to manipulate data

→ comparison between Filesystem & DBMS

## Filesystem

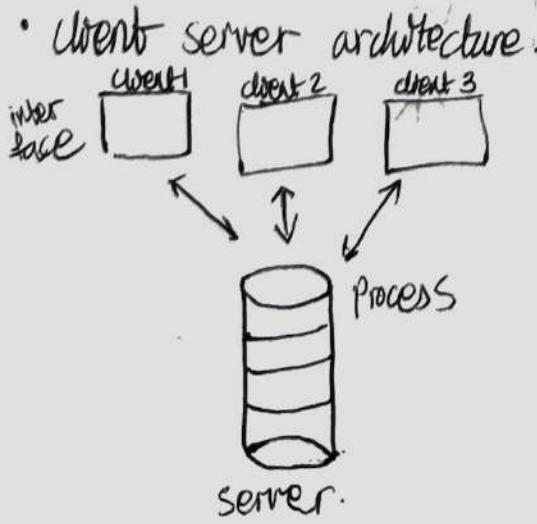

- Searching is very slow and memory utilization is inefficient
- Attributes / metadata required to access data
- Concurrency of data is not possible
- No security protocol
- Data redundancy

## DBMS

- Searching is fast and memory utilization is efficient.
- Data accessed through remote servers.
- Concurrency is possible.
- Security is Role based.
- No data redundancy.

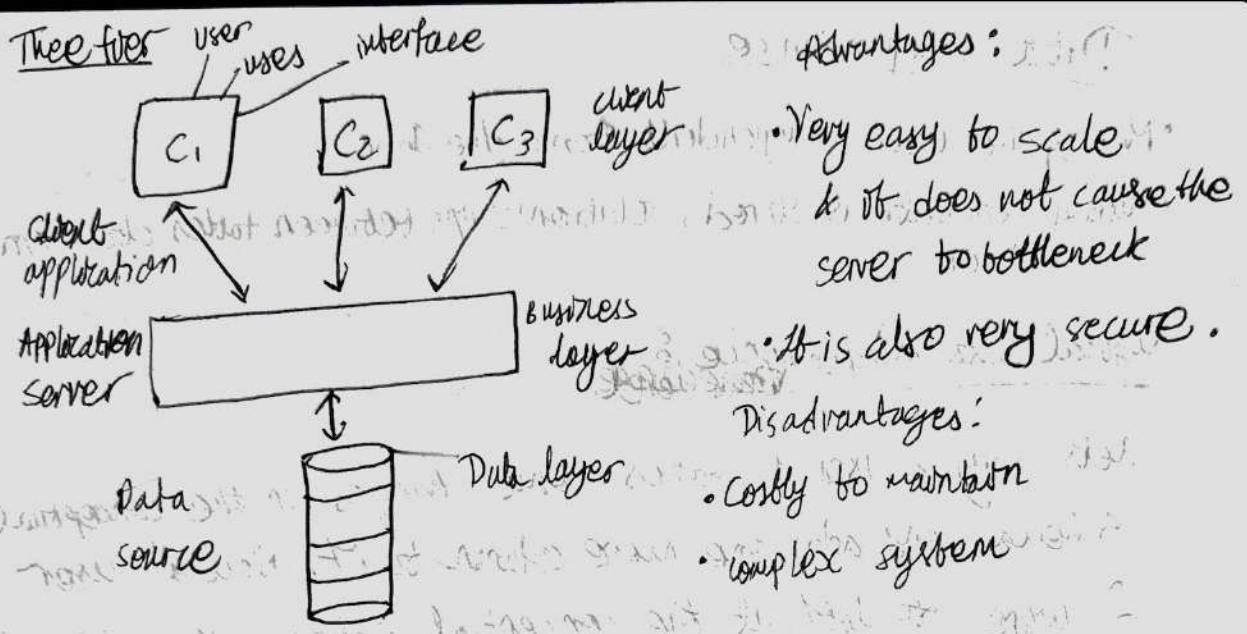

# DBMS - Architecture

## 2-tier

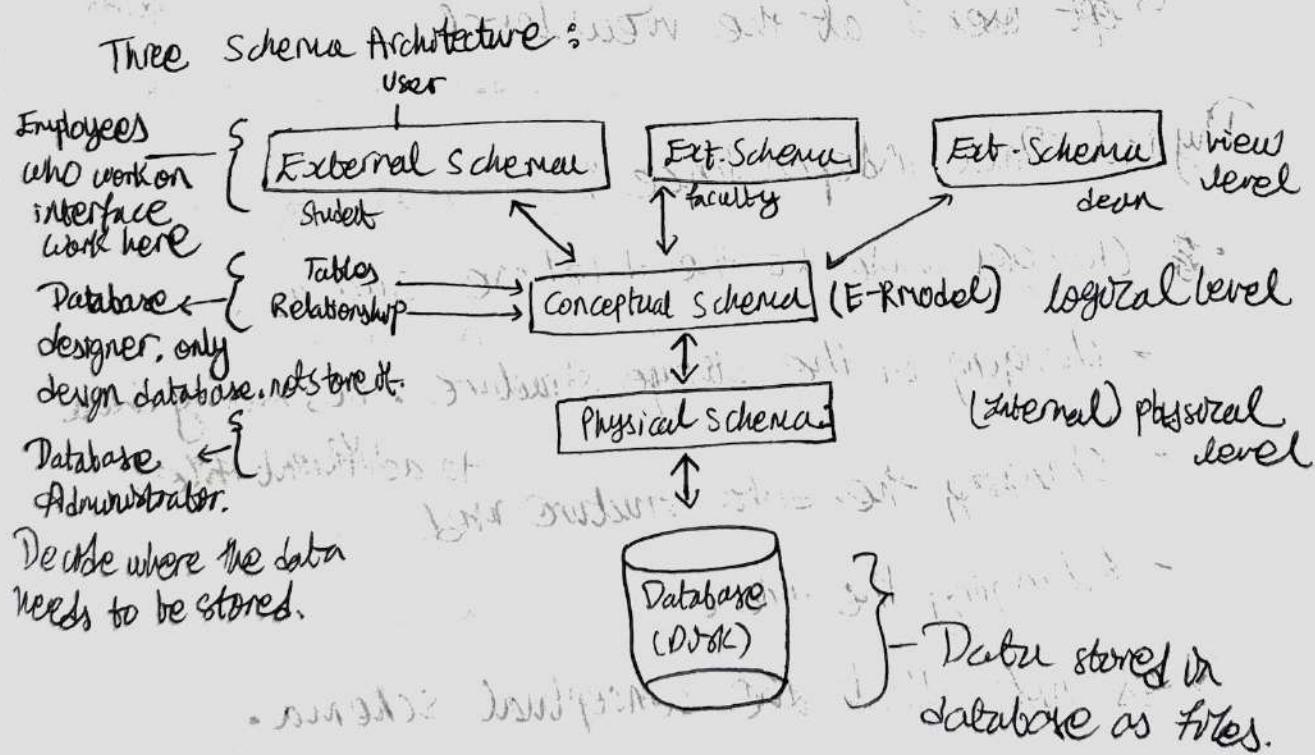

Advantages : DB advantages :

- Maintenance is very easy
- Scalability is an issue
- Security - client interacts directly with the server which can cause problems

Schema → It is the logical Representation of the database.

## Data independence

- Making the user independent from the data.
- Hiding how data is stored, relationships between tables etc from user.

## Logical data independence

lets say a user 1, makes some changes in the conceptual schema and adds one more column to it. Now if user 2 were to look at the conceptual schema, they would only find the original table which was present. Therefore, The ~~log~~ data ~~or~~ / table did not change for everyone ~~except~~ except user 1 at the view level.

## Physical Data independence

- Changes made to the database such as:
  - changing of the storage structure : i.e; moving data
  - changing the data structure <sup>to different file</sup> used.
  - changing the index.

Does not affect the conceptual schema.

Summary : changes in conceptual schema does not affect view level

changes in physical schema does not affect conceptual schema.

## Integrity Constraints

- Integrity constraints are rules defined in a database to maintain data accuracy, consistency & reliability.
- They assure that data stored in a database follows predefined rules and conditions.

Domain constraints : They define the set of valid values that a specific attribute in a table can hold.

e.g. Data type, Range constraints (age ≠ negative), length constraints (name cannot exceed 50 char), regular expression.

Integrity:

Not null: It enforces a column to not accept null values

Foreign key: It is used to enforce referential integrity.

between tables in a relational database:

- It can contain null values
- Can be defined by create table or alter table statement

Characteristics:

- one or more portable
- can be null
- one or more columns corresponding to who columns.

## Database User :

- Sophisticated user : form request in a database query language
- Specialized user : write specialized database applications that do not fit into the traditional data processing framework
- Naive user : invoke one of the permanent application programs that have been written previously

## Database Administrator

- Coordinates all the activities of the database system
- Has a good understanding of the enterprise information resources and needs
- Database Administrator's responsibilities include:
  - Schema definition
  - Storage structure & access method definition
  - Schema & physical organization modification
  - Granting user authority to access the database
  - Specifying integrity constraints
  - Acting as liaison with users
  - Monitoring performance & responding to changes in requirement

Transaction is a collection of operations that performs a single logical function in a database application.

- Transaction management component ensures that the database remains in a consistent / correct state despite system failure.
- Concurrency - control manager controls the interaction among concurrent transactions, to ensure the consistency of database.
- A storage manager is a program module that provides the interface between low-level data stores in the database & the application programs & queries submitted to the system.
  - interaction with file managers
  - efficient storage, retrieving & updating of data.

### Types of Databases :

- 1) Commercial Database : Used in business sector to handle large volume of transactions & customer data. e.g. ECRM system
- 2) Multimedia Database : stores data types such as images, audio & video files. Eg. YouTube, Adobe Experience manager.
- 3) Deductive Database : uses logic programming to derive information stored in database, allowing more complex & analytical queries.
- 4) Temporal database : keeps track of changing data over time, allowing queries, concerning time based data.
- 5) Geographical Information System (GIS) : stores, organises & analyses geographical data. useful in mapping projects. e.g. google maps.

## Entity-Relationship Model (ER Model)

- Entity relationship diagram which helps the user to understand complex database easily using block diagrams. It also shows relationship between different data in a database.

⇒ Entity:

smallest piece of information which can be stored in the database, which is also ~~used~~ ~~to~~ differentiable from other entity.

Types of entity:

- (i) Tangible: Physically exists IRL, e.g. doctors
- (ii) Intangible: Exists logically. e.g. Accounts

⇒ Entity set: collection of same types of entities that share same properties or attributes.

**Entity** → representation

Attributes: The unit that defines the properties & characteristics of entities

## Types of attributes:

single values : Attributes having single value at any instance.

eg. DOB, Aadhar no.

DOB

Multi value : Attributes which can have more than one value

eg. Phone no. email

Email

Simple : Attributes which cannot be further divided into sub-parts.

Composite : Attributes which can be divided into sub-parts

eg. Name

FName

Name

LName

Stored : Attributes whose values are permanently stored in db.

Derived : values of these attributes can be derived from another attributes. Eg. Age can be derived from DOB.

Relationship : Association between two or more entities of same or different entity set.

## Mapping cardinalities:

- (i) one to one (1:1)
  - (ii) one to many (1:M)
  - (iii) Many to one (M:1)
  - (iv) Many to Many (M:M)
- or  
(M:N)

Strong entity : Has a primary key strong

weak entity : Does not have a primary key weak

## Keys

Super Key : Set of attributes using which we can identify each tuple uniquely is called super key  
eg RollNo, age / RollNo, name

Candidate Key : Minimal set of attributes using which we can identify each tuple uniquely is called candidate key.  
eg. AuthorID, id, roll no etc. we choose PK from it.

Primary Key : It is a unique identifier by which you can access a particular record. It should not contain null values. There should be exactly one primary key per table.

Foreign Key : It acts as a reference to the primary key of same or other table to represent relationship.

Secondary Key : It can also act as a primary key to speed up data retrieval. It does not necessarily contains unique values.

Composite Key : Key composed of more than one attribute.

## Module 2

Module 2 (ER Model)

### Relational Design Phase

#### Enhanced ER Model

##### Generalization

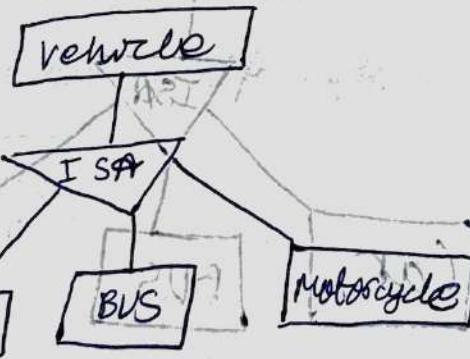

- Generalization is the process of extracting common properties from a set of entities & create a generalized entity from it.

It is a bottom-up approach (two or more sub-classes come from lower levels are combined together to form a superclass)

- It is used to emphasize the similarities among lower level entity sets & hide differences in the schema.

entity sets  
super-class  
sub-classes

eg)  
super-class  
sub-classes

generalization  
(bottom-up approach)

Object Model

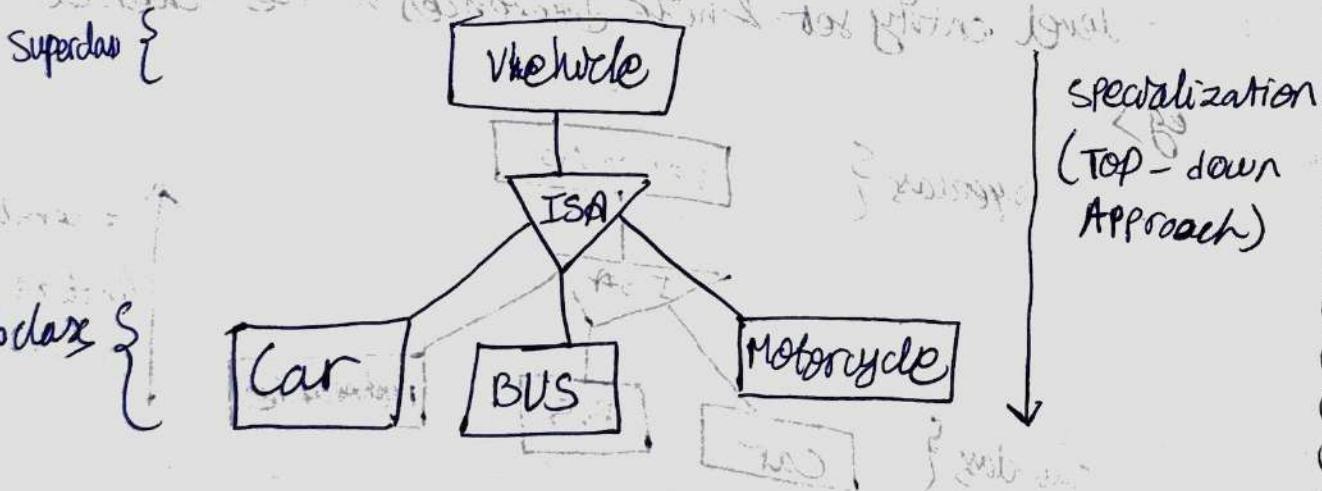

Object Model is an object-oriented approach in which objects are represented as instances of classes. These objects have attributes and methods. Methods are used to perform operations on the objects. Objects can interact with each other through message passing. This allows for distributed processing and real-time systems.

## Specialization

• ~~Generalization~~

- \* In specialization, an entity is broken down into sub-entities based on their characteristics.
- It is a top-down approach. (where superclass gets divided into multiple subclasses)
- It is used to identify the subset of an entity set that shares some distinguishing characteristics.

eg) Normally, the superclass is defined first, the subclass and its related attributes are defined next, and relationship set is then added.

## Inheritance

- It is an important feature of both generalisation & specialization
- Attribute inheritance allows lower level entities to inherit the attributes of higher level entities.

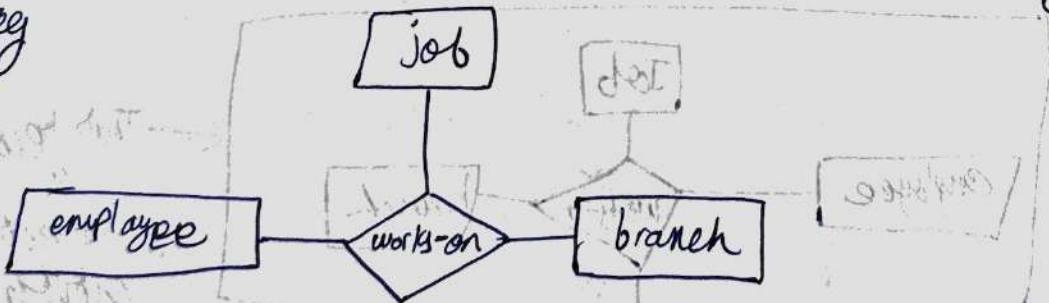

eg) Consider relations car & bus inheriting the attributes of vehicle. Thus, car is described by attributes of super-class vehicle as well as its own attributes.

- This also extends to Participation inheritance, in which relationships involving higher-level entity-sets are also inherited by lower-level entity sets.

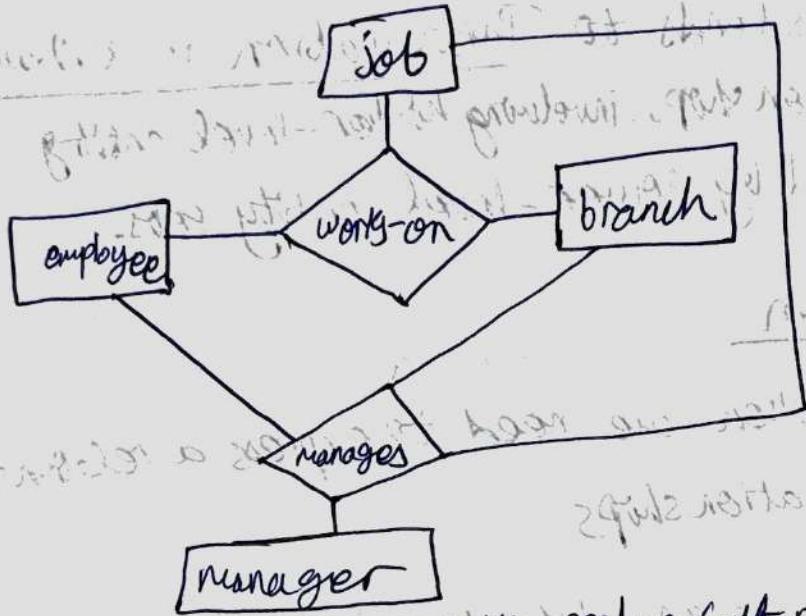

### Aggregation

- It is used when we need to express a relationship among relationships
- Aggregation is an abstraction through which relationships are treated as higher level entities.
- Aggregation is a process when a relationship between two entities is considered as a single entity and again this single entity has a relationship with another entity.

eg

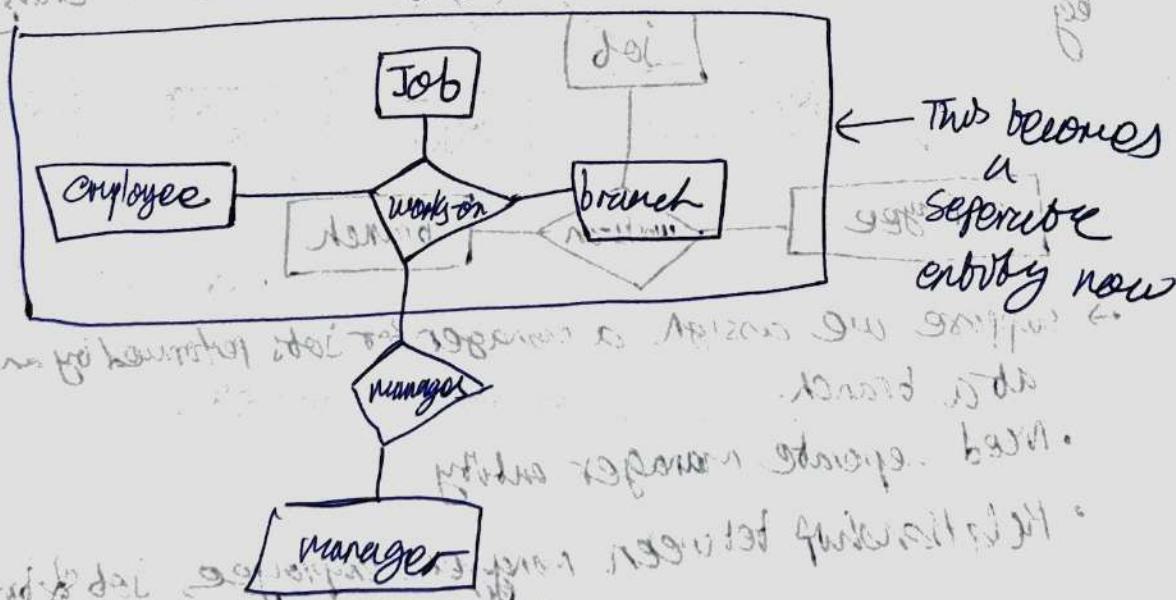

- suppose we assign a manager for jobs performed by an employee at a branch.
- Need separate manager entity,
- Relationship between manager, employee, job & branch entity.

E-R diagram with redundant relationship

Relationship sets works-on & manages are overlapping  
 and redundant information.

Now, with aggregation

# Relational Algebra

OR  
IS  
P  
"operators"

( $\rightarrow$ ) relation

## Basic operators:

- Projection ( $\pi$ )
- Selection ( $\sigma$ )
- Cross Product ( $\times$ )
- Union ( $\cup$ )
- Rename ( $\rho$ )
- Set Difference (-)

## Derived operators:

- Join ( $\bowtie$ )
- Intersection ( $\cap$ )

$$(X \cap Y) = X - (X - Y)$$

- Division ( $/, \div$ )

Entity-relationship  
(ER) model - normal

## Projection ( $\pi$ )

| Roll no. | Name | Age | ( $\times$ ) dubbing error |
|----------|------|-----|----------------------------|
| 1        | A    | 20  | 3   8   A                  |
| 2        | B    | 21  | 6   8   1                  |
| 3        | A    | 19  | 4   8   5                  |

Query: Retrieve the roll no from table (student).

$\pi_{\text{roll no.}}(\text{student}) \rightarrow \frac{\text{name}}{\text{A}}$  (No duplicable values, only distinct values)

| Roll no. | Name |
|----------|------|
| 1        | A    |
| 2        | B    |
| 3        | A    |

Spec. expression to query

## Selection ( $\sigma$ )

Query: Retrieve the name of the student whose Roll no = '2'.

Ans  $\Rightarrow$

~~Roll no~~ ~~name~~ ~~Age~~ ~~Students~~

π<sub>name</sub> ~~name~~, Roll no = '2' (student)

| Roll no | Name | Age |
|---------|------|-----|
| 1       | A    | 20  |
| 2       | B    | 21  |
| 3       | A    | 19  |

Roll no | Name | Age

2 | B | 21

Projection = columns

selection = Rows (tuples)

## Cross product ( $\times$ )

| R   |   | S          |   | T         |   |
|---|---|------------|---|-----------|---|
| A   | B | 1          | 2 | 3         | 4 |
| 1   | 2 |            |   |           |   |
| 2   | 1 |            |   |           |   |
|   |   | (2 tuples) |   | n columns |   |
| C   | D | E          |   |           |   |
| 3   | 4 | 5          |   |           |   |
| 2   | 1 | 2          |   |           |   |
|   |   | (2 tuples) |   | n rows    |   |
| T = no. of tuples $\Rightarrow x \times y \Rightarrow 2 \times 2$ |   |            |   |           |   |
|   |   |            |   |           |   |

$\pi_1$  tuples

n columns

n rows

$\Rightarrow m+n$

$\Rightarrow 3+6 \Rightarrow 6$

why did we take 2 C's?

$\Rightarrow$  At least one column should be common for cross product

## Set Difference (-)

|   |   |
|---|---|
| $A - B = A \text{ but not } B$<br>$A - B \neq B - A$<br>$\downarrow$<br>$S_1 = 1, 2, 3$<br>$S_2 = 3, 4$<br>$S_1 - S_2 = 1, 2$<br>$S_2 - S_1 = 4$<br>$\therefore (S_1 - S_2) \neq (S_2 - S_1)$ | $= A \cap B'$<br>$\text{(student)} - \text{(Employee)}$ |
|---|---|

1) No. of columns must be same

2) Domains must be same

Remove name of a person who is a student but not emp:

Query :  $(\Pi \text{name}(\text{student})) - (\Pi \text{name}(\text{Employee}))$

| name |
|------|
| B    |
| C    |

## Union (U)

$$S_1 = 1, 2, 3 \quad S_2 = 4, 5$$

$$S_1 \cup S_2 = 1, 2, 3, 4, 5$$

| Roll no | name | Empno | name |
|---------|------|-------|------|
| 1       | A    | F     | E    |
| 2       | B    | I     | A    |
| 3       | C    |       |      |

| name |
|------|
| A    |
| B    |
| C    |
| E    |

- 1) No. of columns must be same
- 2) Domains at every column must be same

Student U Employee

| Roll no. | Name |
|----------|------|
| 1        | A    |
| 2        | B    |
| 3        | C    |
| 7        | E    |

$\hookrightarrow (\Pi \text{name}(\text{student})) \cup (\Pi \text{name}(\text{Employee}))$

# Division Method ( $\div$ )

After update  
Delete  $\rightarrow$  drop

| Sid            | Cid            | course 'C'     |                           |
|----------------|----------------|----------------|---------------------------|
| S <sub>1</sub> | C <sub>1</sub> | C <sub>1</sub> | A + B - (A - B)           |
| S <sub>2</sub> | C <sub>1</sub> | C <sub>1</sub> | A - B + A - B             |
| S <sub>1</sub> | C <sub>2</sub> | C <sub>2</sub> | $\Sigma S_i = \Sigma C_i$ |
| S <sub>3</sub> | C <sub>2</sub> | C <sub>2</sub> | $\Sigma C_i = \Sigma S_i$ |

Enrolled

Query: Retrieve all students who enrolled in every course

all / every  $\rightarrow$  division method

all

$A(x, y) / B(y) =$  It results  $x$  values for that there should be tuple  $(x, y)$  for every  $y$  value of relation  $B$ .

$\pi_{(S1, C1)}((\pi_{S1}(Enrolled) \times \pi_{C1}(course)) \cap S_1)$

$\pi_{S1}(Enrolled) - ((\pi_{S1}(Enrolled) \times \pi_{C1}(course)) \cap S_1) = (Enrolled)$

| S <sub>1</sub> | C <sub>1</sub> |
|----------------|----------------|
| S <sub>1</sub> | C <sub>1</sub> |
| S <sub>2</sub> | C <sub>1</sub> |
| S <sub>2</sub> | C <sub>2</sub> |
| S <sub>3</sub> | C <sub>1</sub> |
| S <sub>3</sub> | C <sub>2</sub> |
| S <sub>4</sub> | C <sub>1</sub> |
| S <sub>5</sub> | C <sub>2</sub> |
| S <sub>6</sub> | C <sub>2</sub> |

$\approx S_1$

| S <sub>1</sub> | C <sub>1</sub> |
|----------------|----------------|
| S <sub>2</sub> | C <sub>1</sub> |
| S <sub>1</sub> | C <sub>2</sub> |
| S <sub>3</sub> | C <sub>2</sub> |

$= (S_2, C_2) \cup (S_3, C_2)$

$\Rightarrow S_1$

$S_1 - S_2 \rightarrow S_1 - S_3 \Rightarrow S_1$

## SQL Queries

### Data Definition language (DDL)

- Create
- Alter
- Drop
- Truncate
- Rename

### Data manipulation language (DML)

- select
- insert
- update
- delete

### constraints

- Primary key
- Foreign key
- check
- unique
- Default
- Not null.

## Create a Table :

### Create Table

CREATE TABLE STUDENTS(

Student ID INT Primary key,

First Name VARCHAR(50),

Last Name VARCHAR(50),

Email VARCHAR(100)

);

## Alter Command :

- Add column/s
- Remove column/s
- Modify ~~column~~ datatype
- Modify datatype length
- Add constraints
- Remove constraints
- Rename column / table.

### ADDING :

e.g. ~~RENAME~~ ALTER TABLE STUDENTS,  
ADD Phone Number VARCHAR(15);

### Drop / Delete a column :

ALTER TABLE STUDENTS

DROP COLUMN Phone Number;

Commands

CREATE DATABASE ~~with~~ [if not exists] DBNAME

USE DBNAME

CREATE TABLE

CREATE INDEX

ALTER TABLE

DELETE

SELECT

INSERT

UPDATE

DELETE

CREATE PROCEDURE

CREATE FUNCTION

CREATE VIEW

ALTER VIEW

CREATE TRIGGER

ALTER TRIGGER

CREATE RULE

## Modifying an existing column:

Interventions

## ALTER TABLE STUDENTS

## INSERT INTO

MODIFY COLUMN PhoneNumber(20);

23 JULY 1944

(-n) (i) (n) (i)

(Gibson's) stock (S)

## Renaming a column :

ALTER TABLE STUDENTS,

RENAME COLUMN PhoneNUmber TO ContactNumber;

## Renaming a Table:

ALTER TABLE STUDENTS,  
RENAME TO Staff;

Drop a table:

~~DROP TABLE STUDENTS;~~

## ADDING A foreign key :

CREATE TABLE orders(

OrderID INT Primary Key,

Customer ID INT NOT NULL,

~~FOREIGN~~ FOREIGN KEY (Customer ID) REFERENCES

Customer (Customer ID)

## Inserting values:

INSERT INTO STUDENTS (StudentID, FirstName, LastName)

~~VALUES~~

(1, 'Ojas', 'chatur'),  
(2, 'Boka', 'choda');

## Deleting values:

DELETE FROM STUDENTS

WHERE StudentID = 1;

## Show table values

SELECT \* FROM STUDENTS  
WHERE StudentID = 1;

## Difference between Alter & Update

Alter

- DDL
- ADD, Remove, modify  
data length, datatype
- etc

Update

- DML

## Update :

UPDATE STUDENTS

SET ~~STUDENTID~~ \*FirstName = 'Soma', LastName = 'bokaa'  
Where ~~STUDENTID~~ = 2;

Delete

DML

DELETE FROM STUDENTS

| ID | Name |
|----|------|
| 1  | John |

DELETE FROM STUDENT;  
WHERE STUDENTID = 1;

- Rollback possible
- Slower

Drop

DDL

DROP TABLE STUDENT;

Truncate

DDL

TRUNCATE STUDENT;

| ID | Name |
|----|------|
| 1  | John |

Deletes all the rows  
in the table.

• More slower. No roll back option

faster

## Practice questions on SQL Queries

| EMP | E_id | E_name | Dept | Salary |
|-----|------|--------|------|--------|
|     | 1    | Ram    | HR   | 10000  |
|     | 2    | Ankit  | MRKT | 20000  |
|     | 3    | Ravi   | HR   | 30000  |
|     | 4    | Minal  | MRKT | 40000  |
|     | 5    | Vimal  | IT   | 50000  |

Maximum Salary

~~SALARY FROM EMP TABLE~~

~~SELECT MAX(SALARY) FROM EMP;~~

→ 50,000.

MAX. Salary + Name

outer query → 80000

SELECT E\_name FROM EMP

WHERE SALARY = (SELECT MAX(salary) from Emp);

↑  
inner query

2<sup>nd</sup> highest salary

MAX  
 SELECT \* (SALARY) FROM EMP  
 WHERE SALARY < (SELECT MAX(SALARY) FROM EMP);  
 => 40,000

Employee name  $\rightarrow$  2<sup>nd</sup> highest

SELECT \* E-name FROM EMP

WHERE SALARY = (SELECT \* MAX(SALARY) FROM  
 EMP WHERE SALARY < (SELECT \* MAX(SALARY)  
 FROM EMP));

Display all dept names & no. of emp working

SELECT \* DEPT, FROM EMP GROUP BY DEPT

SELECT \* DEPT, COUNT(DEPT) FROM EMP GROUP BY DPT;

|               |      |   |
|---------------|------|---|
| $\Rightarrow$ | M R  | 2 |
|               | MRKT | 2 |
|               | IT   | 2 |

Dept names less than 2 employees

SELECT \* DEPT FROM EMP GROUP BY DEPT HAVING COUNT(DEPT) < 2;

↓ now add name of employee who works on this dept

SELECT E\_NAME FROM EMP WHERE DEPT IN ();

(Ans me (granted) KAM IS THE WHERE SALARY)

Dept wise highest salary & name of employee

SELECT E\_NAME FROM EMP WHERE SALARY

IN (SELECT MAX(SALARY) FROM EMP GROUP BY DEPT);

Details of employee whose address is Delhi, Chandigarh or punjab

SELECT \* FROM EMP WHERE ADDRESS IN ('DELHI',  
'CHANDIGADH', 'PUNJAB')

~~Details of emp~~

Details of employee working on atleast one project

SELECT \* FROM EMP WHERE EID EXISTS (SELECT  
EID FROM PROJECT WHERE  
EMP.EID = PROJECT.EID)

SELECT MAX SALARY FROM EMP;

SELECT MIN SALARY FROM EMP;

SELECT COUNT(\*) FROM EMP

= 6

Avg

Sum FROM EMP
